**NOVEL QUINUCLIDINE DERIVATIVES AND MEDICINAL COMPOSITIONS  
CONTAINING THE SAME**

This invention relates to new therapeutically useful quinuclidine derivatives, to  
5 some processes for their preparation and to pharmaceutical compositions containing  
them.

The novel structures according to the invention are antimuscarinic agents with a  
potent and long lasting effect. In particular, these compounds show high affinity for  
muscarinic M3 receptors. This subtype of muscarinic receptor is present in glands and  
10 smooth muscle and mediates the excitatory effects of the parasympathetic system on  
glandular secretion and on the contraction of visceral smooth muscle (Chapter 6,  
*Cholinergic Transmission*, in H.P. Rang et al., *Pharmacology*, Churchill Livingstone,  
New York, 1995).

M3 antagonists are therefore known to be useful for treating diseases  
15 characterised by an increased parasympathetic tone, by excessive glandular secretion  
or by smooth muscle contraction (R.M. Eglen and S.S. Hegde, (1997), *Drug News  
Perspect.*, 10(8):462-469).

Examples of this kind of diseases are respiratory disorders such as chronic  
obstructive pulmonary disease (COPD), bronchitis, bronchial hyperreactivity, asthma,  
20 cough and rhinitis; urological disorders such as urinary incontinence, pollakiuria,  
neurogenic or unstable bladder, cystospasm and chronic cystitis; gastrointestinal  
disorders such as irritable bowel syndrome, spastic colitis, diverticulitis and peptic  
ulceration; and cardiovascular disorders such as vagally induced sinus bradycardia  
(Chapter 7, *Muscarinic Receptor Agonists and Antagonists*, in *Goodman and Gilman's*  
25 *The Pharmacological Basis of Therapeutics*, 10th edition, McGraw Hill, New York,  
2001).

The compounds of the invention can be used alone or in association with other  
drugs commonly regarded as effective in the treatment of these diseases. For example,  
they can be administered in combination with  $\beta_2$ -agonists, steroids, antiallergic drugs,  
30 phosphodiesterase IV inhibitors an/or leukotriene D4 (LTD4) antagonists for  
simultaneous, separate or sequential use in the treatment of a respiratory disease. The  
claimed compounds are useful for the treatment of the respiratory diseases detailed  
above in association with  $\beta_2$ -agonists, steroids, antiallergic drugs or phosphodiesterase  
IV inhibitors.

Compounds with related structures have been described as anti-cholinergic and/or anti-spasmodics agents in several patents.

For example, FR 2012964 describes quinuclidinol derivatives of the formula

- 10 ((\*): Configuration not assigned; either the (2R)- or the (2S)- isomers of the above compounds may be produced).

The present invention also provides processes for preparing compounds of formula (I). The quaternary ammonium derivatives of general formula (I), may be prepared by reaction of an alkylating agent of general formula (II) with compounds of general formula (III). In formulae (I), (II) and (III),  $R^1$ ,  $R^2$ ,  $R^3$ , B, A, X,  $R^4$ ,  $R^5$ ,  $R^6$ , n, m and p are as defined above.

20

In formula (II), W represents any suitable leaving group, such as a group X as defined above. Preferably, W represents a group X.

This alkylation reaction may be carried out by two different experimental procedures, a) and b) which are described above. In particular method b) provides a new experimental process, using solid phase extraction methodologies, that allows the parallel preparation of several compounds. Methods a) and b) are described in the

25

experimental section. If W represents a group other than X, the quaternary ammonium salt of formula (I) is produced from the product of method (a) or (b) by carrying out an exchange reaction according to standard methods to replace the anion W<sup>-</sup> with the desired anion X<sup>-</sup>.

5

Compounds of general formula (II) which are not commercially available have been prepared by synthesis according to standard methods. For example, compounds wherein  $n = 0$  and  $A = -O-$ ,  $-S-$  or  $-NR^9-$ , wherein  $R^9$  is as defined above, were obtained by reaction of the corresponding aromatic derivative or its potassium salt  
 10 with an alkylating agent of general formula  $Y-(CH_2)_m-X$ , wherein X may be a halogen and Y may be a halogen or a sulphonate ester. In other examples, compounds of general formula (II), where  $n \geq 1$  were synthesised from the corresponding alcohol derivative of general formula (IV) by known methods

15 wherein  $R^1$ ,  $R^2$ ,  $R^3$ ,  $n$ ,  $m$ , and  $A$  are as defined above.

Compounds of general formula (III) may be prepared by different methods. These procedures are illustrated in the following schemes and detailed in the experimental section.

Method c)

20 Compounds of general formula (III) may be synthesised by transesterification of a compound of formula (V) with a compound of formula (VI).

25 in which formulae  $R^4$ ,  $R^5$ ,  $R^6$  and  $p$  are as defined above and L represents a leaving group. For example L may be a chlorine atom, an imidazol-1-yl group, or a group -

OR<sup>14</sup> wherein R<sup>14</sup> represents a straight or branched, substituted or unsubstituted lower alkyl group or a -COR<sup>15</sup> group wherein R<sup>15</sup> represents -COCR<sup>4</sup>R<sup>5</sup>R<sup>6</sup>. Typically L is -OR<sup>14</sup> wherein R<sup>14</sup> is methyl, ethyl or propyl, or L is an imidazol-1-yl group.

Intermediates of formula (VI) may be prepared by standard methods described in the literature, for example as in FR 2012964.

#### Method d)

Compounds of formula (III) where R<sup>6</sup> is a hydroxy group and p, R<sup>4</sup> and R<sup>5</sup> are as described above, may also be prepared from the glyoxalate esters of general formula (VII) by reaction with the corresponding Grignard reagent.

Compounds of general formula (VII) may be prepared by standard methods described in the literature (WO 01/04118; WO 92/04346)

#### Method e)

Compounds of formula (III) where R<sup>6</sup> is a group -CH<sub>2</sub>OH, and p, R<sup>4</sup> and R<sup>5</sup> are as described above, may also be prepared from the corresponding compound of formula (III), where R<sup>6</sup> is an hydrogen atom, by reaction with formaldehyde in basic conditions. (Organic Syntheses Collective Volumes, VII, 271-274, (1990) ; WO 93/06098)

As will be described in the experimental part, the diastereomers of the compounds of formula (III) may be separated by conventional methods, for example by column chromatography or crystallisation.

The following compounds are compounds of general formula (III) which have not been described before:  
compounds of formula (III)

(III)

wherein p, R4, R5 and R6 are as defined above, the substituent on the azabicyclo group is at position 3 or 4 and when it is at position 3 this substituted carbon has an enantiomerically pure R or S configuration, provided that when R4 is a 3-thienyl group and R5 is a cyclohexyl group R6 is not a hydroxy group.

The substituent on the azabicyclo group is preferably at position 3 and may have R or S configuration. The carbon substituted by R<sup>4</sup>, R<sup>5</sup> and R<sup>6</sup> may have R or S configuration. The compound may be a single isomer.

Examples of the new compounds of formula (III) include:

In particular:

30 The spatial configurations of the compounds of general formula (III) have been deduced from the configurations of their corresponding acids. These were determined either comparing the values of [α] obtained with the values described in the literature or applying the Circular Dichroism (CD) technique.

Since the CD curve of (2S)-2-Cyclohexyl-2-hydroxy-2-phenylacetic acid is known (A. Tambuté and A. Collet, Bulletin de la Société Chimique de France, 1984, N° 1-2, pages II77 to II82) and all the acids evaluated are structurally very similar to (2S)-

2-Cyclohexyl-2-hydroxy-2-phenylacetic acid, it can be assumed that the relative positions of the aryl, cycloalkyl, carboxyl and hydroxyl substituents may be identified by comparison of their respective  $\Delta\epsilon$  values. The resulting configurations have been expressed as R or S according to Cahn-Ingol-Prelog system. (see TABLE 1)

- 5        The curves of CD spectra were recorded with a Jasco-720 spectrophotometer (Software J-700) from 0.43 mM MeOH solutions of the samples in 1 mm cells at 25°C.

The inhalant compositions may contain between 1  $\mu$ g and 1,000  $\mu$ g, preferably from 10  $\mu$ g to 800  $\mu$ g of active ingredient. In human therapy, the dose of the compound of general formula (I) depend on the desired effect and duration of treatment; adult doses are generally between 3 mg and 300 mg per day as tablets and 10  $\mu$ g and 800  $\mu$ g per day as inhalant composition.

### Pharmacological Action

The results on human muscarinic receptors binding and in the test on bronchospasm in guinea pig, were obtained as described below.

30

#### **Human muscarinic receptor studies.**

The binding of [3H]-NMS to human muscarinic receptors was performed according to Waelbroek et al (1990), Mol. Pharmacol., 38: 267-273. Assays were carried out at 25°C. Membrane preparations from stably transfected chinese hamster ovary-K1 cells (CHO) expressing the genes for the human muscarinic receptors M3 were used.

35

For determination of  $IC_{50}$ , membrane preparations were suspended in DPBS to a final concentration of 89  $\mu\text{g/ml}$  for the M3 subtype. The membrane suspension was incubated with the tritiated compound for 60 min. After incubation the membrane fraction was separated by filtration and the bound radioactivity determined. Non  
5 specific binding was determined by addition of  $10^{-4}$  M atropine. At least six concentrations were assayed in duplicate to generate individual displacement curves.

Our results show that the compounds of the present invention have high affinities for muscarinic M3 receptors, preferably human muscarinic receptors. Affinity  
10 levels have been measured by in vitro assays as described above at 100 nM and 10 nM. Preferred compounds of the invention produce an inhibition of  $[^3\text{H}]\text{-NMS}$  binding of at least 35 % at 10 nM and of at least 65 % at 100 nM (Table 2).

### Test on bronchospasm in guinea pig

The studies were performed according to H. Konzett and F. Rössler (1940), Arch. Exp. Path. Pharmacol. 195: 71-74. Aqueous solutions of the agents to be tested were nebulized and inhaled by anaesthetized ventilated male guinea pigs (Dunkin-Hartley). Bronchial response to intravenous acetylcholine challenge was determined before and after drug administration and the changes in pulmonary resistance at several time-points were expressed as percent of inhibition of bronchoespasm.

The compounds of the present invention inhibited the bronchospasm response to acetylcholine with high potency and a long duration of action.

From the above described results one of ordinary skill in the art can readily understand that the compounds of the present invention have excellent antimuscarinic activity (M3) and thus are useful for the treatment of diseases in which the muscarinic M3 receptor is implicated, including respiratory disorders such as chronic obstructive pulmonary disease (COPD), bronchitis, bronchial hyperreactivity, asthma, cough and rhinitis; urological disorders such as urinary incontinence, pollakiuria, neurogenic or unstable bladder, cystospasm and chronic cystitis; gastrointestinal disorders such as irritable bowel syndrome; spastic colitis, diverticulitis and peptic ulceration; and cardiovascular disorders such as vagally induced sinus bradycardia. For example, the compounds of the present invention are useful for the treatment of respiratory diseases such as chronic obstructive pulmonary disease, chronic bronchitis, asthma, and rhinitis; urinary diseases such as urinary incontinence and pollakinuria in neuripenia pollakinuria, neurogenic bladder, nocturnal enuresis, unstable bladder, cytospsasm and chronic cystitis; and gastrointestinal diseases such as irritable bowel syndrome, spastic colitis and diverticulitis.

The present invention further provides a compound of formula (I) or a pharmaceutically acceptable composition comprising a compound of formula (I) for use in a method of treatment of the human or animal body by therapy, in particular for the treatment of respiratory, urological or gastrointestinal disease or disorder.

The present invention further provides the use of a compound of formula (I) or a pharmaceutically acceptable composition comprising a compound of formula (I) for the manufacture of a medicament for the treatment of a respiratory, urological or gastrointestinal disease or disorder.

Further, the compounds of formula (I) and pharmaceutical compositions comprising a compound of formula (I) can be used in a method of treating a respiratory, urological or gastrointestinal disease or disorder, which method comprises

administering to a human or animal patient in need of such treatment an effective, non-toxic, amount of a compound of formula (I) or a pharmaceutical composition comprising a compound of formula (I).

Further, the compounds of formula (I) and pharmaceutical compositions  
5 comprising a compound of formula (I) can be used in combination with other drugs effective in the treatment of these diseases. For example with  $\beta_2$  agonists, steroids, antiallergic drugs, phosphodiesterase IV inhibitors and/or leukotriene D4 (LTD4) inhibitors, for simultaneous, separate or sequential use in the treatment of a respiratory disease.

10 The present invention therefore further provides a combination product comprising

- (i) a compound according to the invention; and
- (ii) another compound effective in the treatment of a respiratory, urological or gastrointestinal disease or disorder

15 for simultaneous, separate or sequential use.

The compound (ii) which is effective in the treatment of a respiratory, urological or gastrointestinal disease or disorder may be a  $\beta_2$  agonist, steroid, antiallergic drug, phosphodiesterase IV inhibitor and/or leukotriene D4 (LTD4) antagonist when the product is for simultaneous, separate or sequential use in the treatment of a respiratory  
20 disease. Alternatively, the compound (ii) may be a  $\beta_2$  agonist, steroid, antiallergic drug and/or phosphodiesterase IV inhibitor when the product is for simultaneous, separate or sequential use in the treatment of a respiratory disease.
